

Open Application – Collaboration & Applied Roles

Nana Kwame Amagyei, PhD

Data, AI & Governance in Practice

Norway · Open to collaboration, roles, and advisory work

I work at the intersection of **data, technology, people, and governance**. My background combines doctoral research in information systems with hands-on experience supporting organisations as they design, govern, and operationalise data- and AI-enabled systems.

Rather than focusing on tools alone, my work centres on **making complex systems understandable, governable, and usable in practice**—especially in public-sector, research-intensive, and sustainability-oriented contexts.

What I bring

- Systems mapping across technology, organisation, and policy
- Data and AI governance grounded in real work practices
- Translation between technical teams, decision-makers, and regulators
- Applied research, teaching, and capacity building
- Pragmatic prototyping where needed (web, data tools, platforms)

Selected case studies

- **Data Curation as Data Governance** – Long-term qualitative study of a European research infrastructure (eLTER), showing how governance is enacted through everyday data work.
- **Sociotechnical Design for Responsible Data & AI** – Cross-cutting work spanning doctoral research, teaching, and applied system design.
- **Public-Sector Digital Transformation in Ghana** – Designing and deploying Microsoft 365–based Smart Workplace platforms for government agencies.

Collaboration

I am open to applied roles, advisory work, and research collaborations where systems thinking, governance, and long-term impact matter. If your organisation is working with complex data or AI systems and needs clarity, structure, or translation across domains, I would welcome a conversation.
